

Team SOP — Building Lightfunnels Pages from Figma with Claude

A step-by-step guide for turning a **Figma design** into a live **Lightfunnels page** using Claude Code. You don't need to write code — you mostly *talk* to Claude in plain English and it does the building for you.

TL;DR: Open your Figma file → tell Claude "build this Figma design as a Lightfunnels page" → review the preview link → ask for tweaks → publish.

1. What this tool does

Normally you'd rebuild a landing page by hand inside the Lightfunnels editor — dragging blocks, matching fonts, colors, and spacing to a design. This tool lets **Claude** do that for you:

- It **reads the design straight from Figma** (exact colors, fonts, sizes, images).
- It **builds the page inside Lightfunnels** for you, matching the design.
- It handles **desktop and mobile** layouts.
- You **review a preview link** and ask for changes in plain language.
- When it looks right, you **publish**.

Think of it as an assistant that edits Lightfunnels for you, guided by the Figma design and your feedback.

2. What you need (once)

1. **Claude Code** installed on your computer (the app you type instructions into).
2. **The project folder** (`lf-agent-bridge`) on your computer.
3. **The Figma desktop app** with the **Figwright plugin** installed — this is how Claude reads your design (see Section 3A). With Figwright you **don't need any Figma key**; it just reads whatever file you have open.
4. **Your own Lightfunnels sign-in**. You do this yourself with one command — `python3 lf.py login` (Section 3B). It saves your session and refreshes itself automatically, so you rarely repeat it. **You never copy or paste any token by hand.**

One-time technical bits (installing the repo, and an optional permanent Lightfunnels app key for read-only listing) are handled once by whoever sets this up. As a day-to-day user, your only sign-in is `python3 lf.py login`.

 **Never share, screenshot, or commit any keys** (the hidden `.env` file or your login session). They're like passwords — they stay on the computer.

3. One-time setup (do this once)

A. Connect Figma (so Claude can read designs)

1. Open the **Figma desktop app** (not the browser version).
2. Open the design file you want to build from.
3. Run the **Figwright** plugin: **Menu** → **Plugins** → **Development** → **Figwright**.
4. Leave it running — it should say "**Connected**."

That's it. As long as Figwright is connected and your file is open, Claude can read whatever design you have open.

B. Sign in to Lightfunnels (so Claude can save pages)

In Claude Code, type:

```
run: python3 lf.py login
```

A browser window opens. **Sign in to Lightfunnels normally** (2-factor is fine). This saves your session so Claude can create and edit pages — no tokens to copy. It **refreshes itself automatically**, so you usually never touch this again; only rerun `python3 lf.py login` if Claude ever says your session fully expired.

C. Quick test

Ask Claude:

"List my Lightfunnels funnels."

If it shows a list, you're ready. 🎉

4. Build a page from a Figma design (the main workflow)

Step 1 — Open the design in Figma

Open the Figma file and make sure the **Figwright plugin says Connected**.

Step 2 — Give Claude the design

Copy the Figma link for the exact frame you want (right-click the frame in Figma → **Copy link to selection**), then tell Claude what you want. For example:

"Build this Figma design as a **new** Lightfunnels page for testing: `<paste Figma link>`. Match it exactly, including the footer."

Be clear about: - **New page vs. edit an existing one** ("create a new funnel" vs. "edit funnel X"). - **Any links/buttons** and where they should go (e.g. "the Buy button links to `https://...`"). - **Anything specific** you care about (footer, disclaimers, star ratings, etc.).

Step 3 — Let Claude work

Claude will read the design in detail (this can take a few minutes for long pages — that's normal; it's measuring every element so it matches). It then builds the page.

Step 4 — Review the preview

Claude gives you a **preview link**. Open it in your browser. - To check **mobile**, open it on your phone or make your browser window narrow.

Step 5 — Ask for tweaks

Tell Claude what's off, in plain words. Examples:

"The Trustpilot stars should be green for the top product." "On mobile the cost table text is too small — match the Figma." "The footer is missing the disclaimer."

Claude fixes it and gives you an updated preview. Repeat until it looks right.

Step 6 — Publish (when approved)

When you're happy, tell Claude:

"Publish it."

⚠ **Claude will always confirm before publishing or deleting.** Publishing makes the page live. If you're not ready, say "not yet."

5. Other common tasks

Edit wording on an existing page

"On funnel `<name/id>`, change 'Customer Reviews' to 'Verified Buyer Reviews'."

Claude reads the real page text first, then makes the exact change.

Duplicate an existing page as a starting point

"Duplicate the `<name>` funnel and call it `<new name>`."

Make a page mobile-friendly / match the mobile design

"Here's the mobile Figma frame: `<link>`. Make the mobile view match it."

Change where a button links

"Point the 'Visit Site' buttons to `https://... .`"

6. Do's and Don'ts

✅ **Do** - Keep the Figma file **open** with **Figwright connected** while Claude works. - Give Claude the **exact Figma link** for the frame you want. - **Review the preview** on both desktop and mobile before publishing. - Be specific with feedback ("the second heading should be 22px and centered").

❌ **Don't** - Don't share, screenshot, or commit the access keys (`.env` , session token). They're private, like passwords. - Don't publish until you've reviewed the preview. - Don't edit a live, published page directly for big experiments — ask Claude to test on a **duplicate** first.

7. Troubleshooting

Problem	What to do
Claude says it can't read the Figma design	Make sure the Figma desktop app is open, the right file is open, and the Figwright plugin says Connected . Then ask Claude to try again.
The preview page is blank or 404	A brand-new page may need publishing before it shows. Tell Claude — it can publish or refresh the preview.
The preview looks out of date	Previews are cached. Ask Claude to "refresh the preview" (it changes the link so you see the latest).
Claude says the Lightfunnels session expired	Run <code>python3 lf.py login</code> again and sign in.
A change didn't save	Ask Claude to confirm it saved in "session mode" — real edits need your login session, which the setup handles automatically.
Something looks slightly off vs. Figma	Point Claude at the specific element or Figma frame link and say what's wrong. It re-measures the design and fixes it.

8. A few words that help you talk to Claude

- **Funnel** = a Lightfunnels project that contains one or more pages.
- **Step / page** = a single page inside a funnel.
- **Preview link** = a private link to see the page before it's live.
- **Publish** = make the page live to the public.
- **Session** = your Lightfunnels login that lets Claude actually save pages.
- **Figwright** = the Figma plugin that lets Claude read your open design.

9. Golden rules (for consistent results)

1. **Always work from the real Figma design** — Claude matches the exact node, so keep the correct frame open in Figma.
 2. **Review before you publish** — always open the preview on desktop *and* mobile.
 3. **Ask for exact changes** — the more specific your feedback, the closer the match.
 4. **Keep keys private** — never share the `.env` or login token.
